Managed and Monitored Servers: Comprehensive, Secure & Fully Supported VPS Hosting

Ridgeon Network offers exceptional managed and monitored server hosting, providing businesses with secure and reliable solutions tailored to their specific needs. Our hosting services are built for outstanding performance and rock-solid security, with proactive managed server support on hand.

Here are just some of the features and benefits Ridgeon Network's managed and monitor server hosting solutions provide.

Key features and benefits

Comprehensive management and monitoring

We handle all aspects of server management, including setup, maintenance and security updates. Our 24/7 monitoring ensures high availability and rapid response to any issues, minimising downtime to keep your business up and running.

Customisable service-level solutions

We know that there's no one-size-fits-all solution. That's why we tailor our hosting solutions to meet your unique requirements, with flexible configurations allowing you to offload as much – or as little – to us as you like.

Secure UK data centres

All our services are hosted in secure UK-based data centres, with ISO27001 and ISO 9001 certification, as well as GDPR and Cyber Essentials compliance. Encryption at rest is included as standard for all servers, while custom firewalling consultancy is part of your server's setup process to ensure secure setup from the outset for your application or service.

Easy versatility

Our servers can be used for a wide range of purposes, including managed/part-managed IIS/Apache or nginx web servers, accounts/financial system hosting, POS servers to service remote thin clients, server hosting for mapped drives or any application/portal your business requires.

Technical expertise and proactive support

We get to know your application so we can support your business as its needs evolve, and we'll monitor your server and your specific application's metrics so that we know about any issues before you or your end users. By being proactive with our monitoring, this allows us to make recommendations to our clients before they even know anything needs doing and allows you to plan for the future of your application or service.

Virtual Private Server Hosting (VPS) - with a difference

Traditionally "VPS" is used as a term to define server hosting but our Monitored & Managed Server Hosting provides so much more. Powered by industry-leading virtualisation and software-defined networking (SDN) technology, we deliver performance and reliability with fully customisable configurations to suit your needs.

We don't just provide a server and leave you to do the rest, we work with you on the setup and ongoing management of the server & networking so that you can concentrate on your application and it's users. Simply provide us with your requirements or a rough outline of your service or application and we will ask all the right questions to provide a custom quotation for your business. Get in touch with the Ridgeon Network team today to find out more.
